

To increase pH Level

Causes:

- Insufficient chlorine
- Excess addition of acid to swimming pool water
- Use of products containing cyanuric acid
- Weather conditions

All dosages are based on an average pool with a capacity of 50 000 litres. Adjust according to your pool size, regional variations and weather conditions.

Note: To raise pH in fibreglass pools, only HTH® Alkalinity Up should be used

Precautions:

In the case of a vinyl or coloured lining, add HTH® Alkalinity Up directly into the weir to prevent possible bleaching.

Treatment

1. To prevent possible staining from metals that may be present in your water, add 1 bottle of HTH® Metal Remover - follow label directions.
2. With the pump running on the filter setting, add cup (250g) of HTH® Alkalinity Up around the slides of the pool. NB: in the case of a vinyl or coloured pool lining, add HTH® Alkalinity Up directly into the weir
3. Filter for 3 – 4 hours. Test pH and readjust if necessary

Recommended Product/s:

HTH® Metal Remover

HTH® Alkalinity Up
